

Build a simple static web page to showcase second-hand items for sale.

The goal is a polished, friendly, modern one-page catalog, with no backend and no database server. All content should come from simple `.txt` files and image files stored in a local content folder.

Project structure:

```
/
  index.html
  styles.css
  script.js
  content/
    landing.txt
    contact.txt
    products/
      item_name.txt
      item_name_1.png
      item_name_2.png
      another_item.txt
      another_item_1.jpg
```

Content rules:

1. `content/landing.txt`
2. Contains the landing-page message.
3. This text should appear in the first full-screen section of the website.
4. Preserve line breaks reasonably.
5. `content/contact.txt`
6. Contains global contact information.
7. This should appear near the top or bottom of the catalog section, and optionally repeated in each product card as a small "Contact" area.
8. Preserve line breaks reasonably.
9. Product files
10. Each product has one `.txt` file inside `content/products/`.
11. The filename stem defines the product ID.

12. Example: `coffee_table.txt` defines the product `coffee_table`.

13. Product text format Each product `.txt` has four lines:

```
Product name/description
Notes
Dimensions
Status
```

Example:

```
Solid wood coffee table
Small chip on one leg
20x30x10
SOLD
```

1. Product images

2. Images are stored in `content/products/`.

3. Images belonging to a product use the same filename stem as the product `.txt`, followed by `_1`, `_2`, `_3`, etc.

4. Example:

- `coffee_table.txt`
- `coffee_table_1.png`
- `coffee_table_2.png`

5. All of these should appear in the same product card.

6. Support `.png`, `.jpg`, `.jpeg`, and `.webp`.

Important implementation note:

Because browsers cannot automatically list local folder contents in a static site, create a simple generated or manually editable manifest file, for example:

```
content/products.json
```

The manifest should list the product IDs:

```
[
  "coffee_table",
  "lamp",
```

```
"chair"  
]
```

The JavaScript should use this manifest to know which `.txt` files to load. For each product ID, it should then try to load images named:

```
product_id_1.png  
product_id_2.png  
...  
product_id_1.jpg  
product_id_2.jpg  
...  
product_id_1.jpeg  
product_id_2.jpeg  
...  
product_id_1.webp  
product_id_2.webp  
...
```

Stop looking for images after a reasonable number, for example 10 images per product.

Page behavior:

1. Landing section
2. Full viewport height.
3. Shows the text from `landing.txt`.
4. Friendly modern layout.
5. Include a clear "See items" button or scroll cue.
6. Smooth scroll to the catalog section.
7. Scroll snapping
8. The page should have two main snap sections:
 - Landing section.
 - Catalog section.
9. Use CSS scroll snapping so scrolling from the landing section naturally lands on the catalog.
10. Catalog section
11. Show the contact information from `contact.txt`.

12. Show all product cards in a responsive grid.
13. On desktop, use multiple columns.
14. On mobile, use one column.
15. Product card design Each card should contain:
 16. Image area at the top.
 17. Product name/description.
 18. Notes.
 19. Dimensions.
 20. Status badge.
 21. Optional contact reminder.
 22. Image browsing
 23. If a product has one image, show it normally.
 24. If a product has multiple images, show them as a small carousel/gallery inside the card.
 25. Include previous/next buttons.
 26. Include small dot indicators or "1 / 3" style counter.
 27. Images should be cropped nicely with `object-fit: cover`.
 28. Clicking an image should open it in a larger modal/lightbox view.
 29. Status styling
 30. If status is `SOLD`, show a clear sold badge and visually mute the card slightly.
 31. Other statuses should still be displayed as badges.
 32. Do not hide sold items unless the code has an easy option to do so later.

Style direction:

- Friendly, polished, modern, Canva-like.
- Soft background.
- Rounded cards.
- Subtle shadows.
- Large readable typography.
- Clean spacing.
- Pleasant hover effects.
- Fully responsive.
- No heavy framework required.
- Use plain HTML, CSS, and JavaScript.

Robustness:

- If a product has no images, show a nice placeholder instead of breaking.
- If a product `.txt` has fewer than four lines, fill missing fields with empty strings or sensible defaults.
- If `landing.txt` or `contact.txt` fails to load, show fallback text.
- Keep the code simple and well-commented.
- Avoid unnecessary dependencies.

Nice-to-have:

- Add a small filter or toggle to hide/show sold items.
- Add a subtle loading state while content loads.
- Add keyboard navigation for the image modal.
- Make the site easy to deploy on GitHub Pages or any static hosting service.

Deliverables:

- `index.html`
- `styles.css`
- `script.js`
- Example `content/` folder with:
 - `landing.txt`
 - `contact.txt`
 - `products.json`
- at least two example products
- Clear comments explaining how to add a new product.
